SAFEGARDING YOUR DIGITAL BOUNDARIES

About SDP

Cyber attackers, after breaching corporate firewalls or cloud networks, can freely move through deployed servers and storage systems without resistance. A Software Defined Perimeter prevents this risk by continuously ensuring that only trusted devices, used by authorized users, can access trusted systems. The unified access solution protects internal and cloud networks and applications.

Cybersecurity Facts

34%
of data breaches involved internal actors

228 Days
The average time to identify a breach in 2020

4.1 billion
Records have been exposed due to data breaches in six months

5%
of companies have properly protected folders and assets

The SDP+ Advantage

Flexible Deployment
We are one of the few players in the zero trust market that offer a cloud-based SDP platform and on-premise SDP options.

Comprehensive Checks
It rigorously plans, checks, monitors and analyzes every access request regardless of its origin (user, device, app).

Least Privilege
Initially, a user has least privilege and can access only limited resources. As the user proves their identity, their trust score increases, allowing them to access more privileged resources.

Switch to SDP+

The recent pandemic showed that being able to work remotely (WFH) is crucial for every organization.

Traditional security products do not offer end-to-end contextual access. Many companies provision and store resources on a network without adequate protection. Switch to SDP+ today and protect your digital assets.
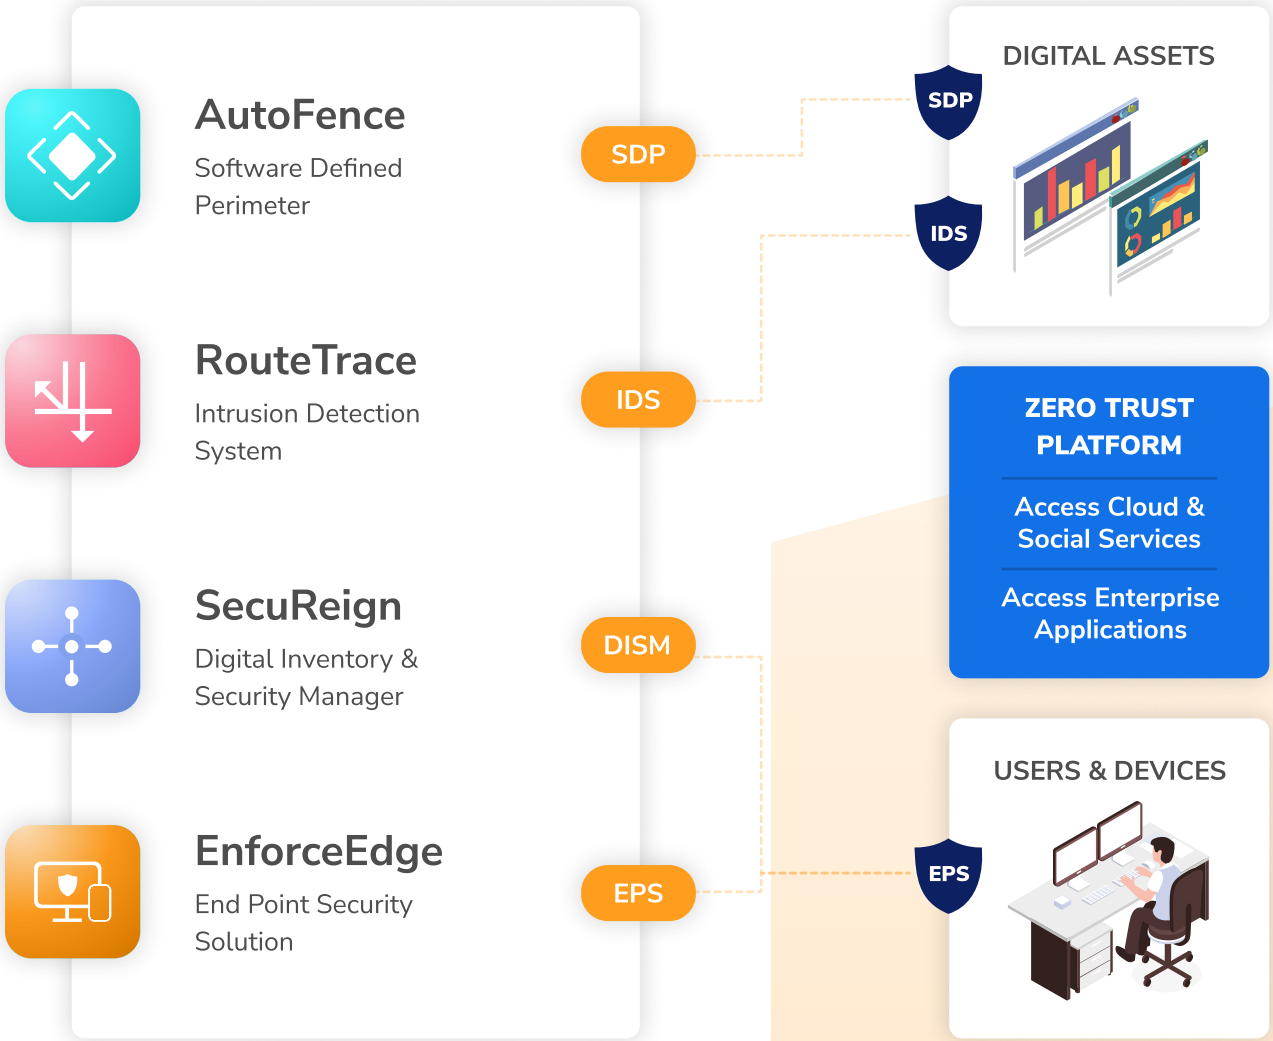

> *We provide cybersecurity solutions based on the zero trust model and other state-of -the-art features*

Our Products

Vigix offers SDP+ as a comprehensive suite of cybersecurity products.

AutoFence
Software Defined Perimeter

SDP

RouteTrace
Intrusion Detection System

IDS

SecuReign
Digital Inventory & Security Manager

DISM

EnforceEdge
End Point Security Solution

EPS
